# Bacterial Biofilms

- Biofilms are layers of microorganisms that have adhered to biological or nonbiological surfaces.
- The extracellular polymeric matrix resists the host immune response and prevents antibiotics from reaching the bacteria cells.
- *Streptococcus mutans*, is the most common of these bacteria, resulting in dental caries and periodontal disease. Poor oral health increases the risk of cardiovascular diseases

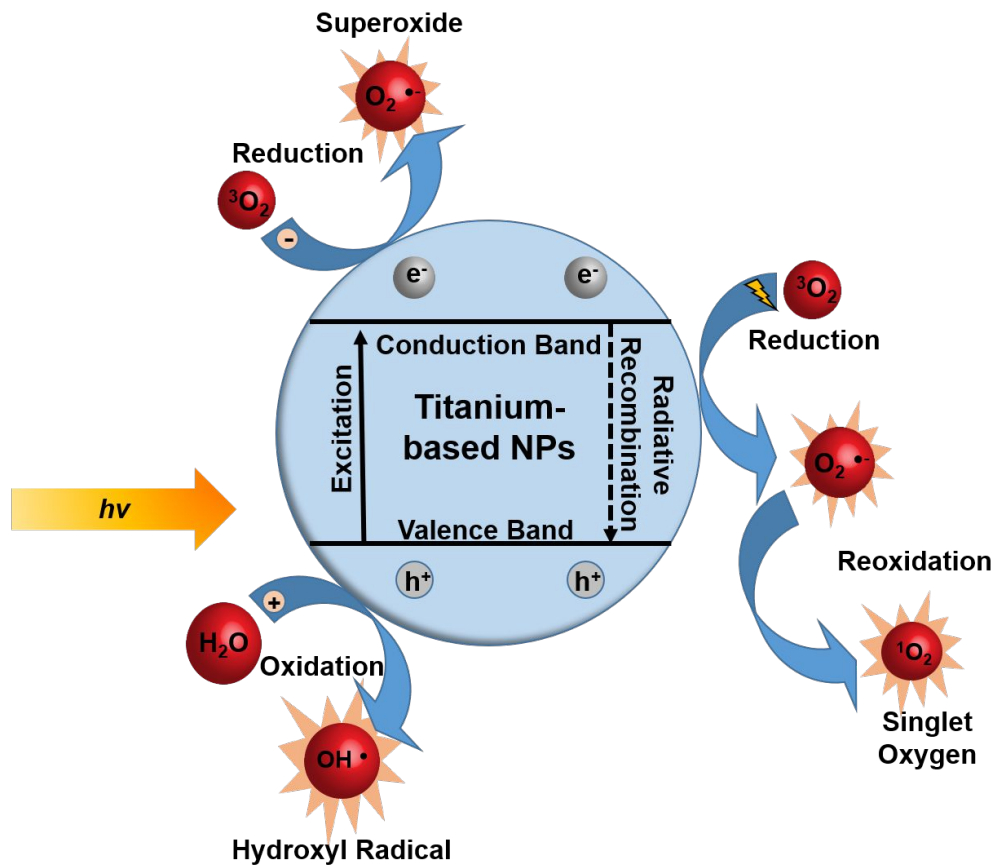

# Titanium Dioxide Nanoparticles

- Titanium dioxide nanoparticles (TiO<sub>2</sub> NPs) are non-toxic and biocompatible materials.
- TiO<sub>2</sub> possesses a large band gap of 3.2 eV, making it active primarily in the UV light wavelength range.
- By heteroatom doping or by molten salt/hydrogen assisted reduction, this band gap can be narrowed to allow for activity, or excitation, within the visible light spectrum.

# Disruption of biofilm by reactive oxygen species

# Methods

# Methods

# Findings

Both H-Mg-TiO<sub>2</sub> and H-Mg-N-TiO<sub>2</sub> NPs produced via two-step reductive annealing method were able to disrupt approximately 75% and 90% of the *S. aureus* biofilm with visible light (white light), respectively.

# Further Exploration

# Acknowledgements

**I would like to thank:**

**My Primary Investigators and Project Mentor: Dr. Anna Cristina Samia**

**Current PhD candidates: Yu Hsin (Terence) Tsai, Nathalie Milbrandt, and Stella Ju**

**The SOURCE office and WISER for Summer 2020 funding**
